

Semantic similarity visualization for a FoodReg nutrient-content rule

Cosine similarity of real span features immediately before the final classifier; the Chinese rule is translated below.

Rule: reduce sugar — compared with a reference food, sugar content is reduced by at least 25%.
The exact IV span is retained by Full SPSR-Net but missed by w/o SNSA at the same decision threshold.

Observed effect: without SNSA, the gold composite IV is more similar to its individual fragments; Full SPSR-Net preserves a more distinct composite-span representation.

Exact gold IV probability: w/o SNSA = $0.194 < \tau = 0.48$; Full SPSR-Net = $0.979 > \tau = 0.48$.

This is a qualitative case study based on one FoodReg test clause, not an aggregate performance measure.
