

HSR strengthens confidence for long food-safety indicator values

Exact gold IV probabilities for four representative FoodReg test rules; each value uses the evaluator's symmetric decision rule.

Each target span jointly encodes a comparison object, a nutrient or energy component, a direction of change, and a numerical threshold.
Thus this case analysis complements the ablation table: it illustrates confidence on concrete regulatory claims rather than another aggregate score.

Mineral increase

Mineral content increases by $\geq 25\%$ versus a reference food

Energy reduction

Energy value decreases by $\geq 25\%$ versus a reference food

Dietary-fibre claim

Dietary fibre changes by $\geq 25\%$ versus a reference food

Sugar reduction

Sugar content decreases by $\geq 25\%$ versus a reference food

w/o HSR

Full SPSR-Net

Across these rules, HSR raises the confidence of the complete regulatory value span while keeping the same decision threshold.

Qualitative case study only. The overall effect is reported separately by the FoodReg ablation results.
